

Conant Custom Brass Comfortmeter:

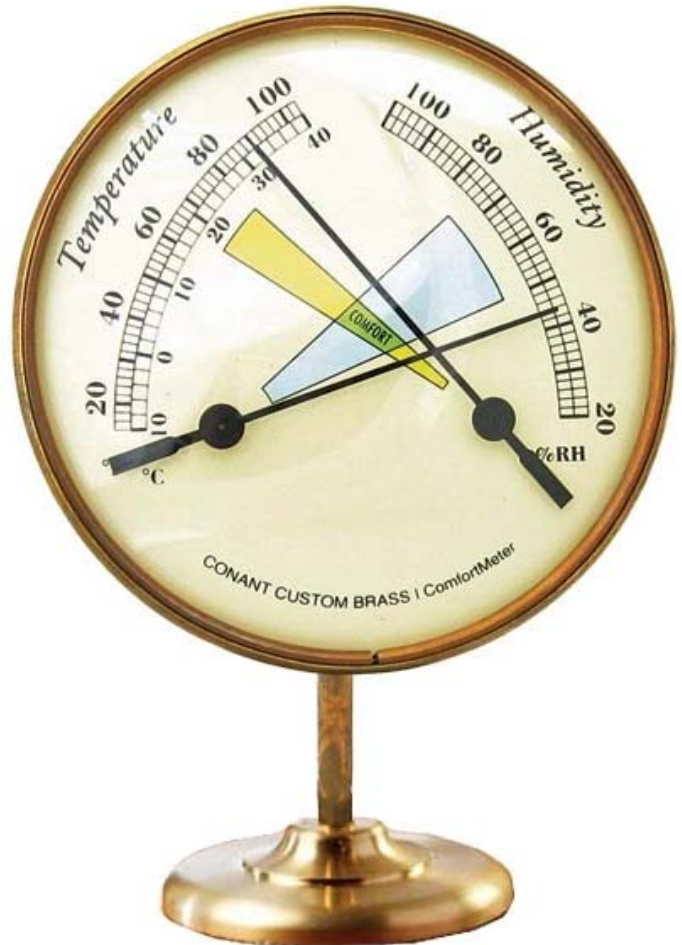

This little instrument not only has a big impact on your personal comfort, but also can have a big impact in the home.

FOR IMMEDIATE RELEASE: June 3, 2009. The Conant Custom Brass Comfortmeter is designed to monitor both temperature and humidity, while featuring the important relationship between the two. The thermometer displays temperature in both Fahrenheit and Celsius on the left scale, and the hygrometer shows % of relative humidity on the right. Graphic design shows the optimal range of temperature in yellow and humidity in blue. The ideal target comfort zone is represented by the green intersection of these two ranges.

This Comfortmeter provides valuable information which can potentially save you time and money; particularly for people with wood cabinets, wood furniture, trim or flooring. In homes like these, lack of humidity can actually damage wood fixtures due to excessive drying out and shrinkage. Conversely, homes with too much humidity are more susceptible to problems such as mold spores and dust mites. When conditions are monitored and kept within the green zone, these issues can more easily be prevented.

The Comfortmeter uses a German movement and an easy-to-read 4.25 inch diameter dial mounted on a solid brass stand for stability making it great for monitoring heating or cooling zones, greenhouses, sunrooms or problem areas. It may be used in combination with a humidifier or de-humidifier to maximize its benefits and your comfort. This unique weather instrument combines practical simplicity with timeless design. The solid brass housing will never corrode, and the highest standards of craftsmanship have been employed to assure that this instrument will provide a lifetime of trouble-free service. Lifetime warranty and glass crystal included.

(Item #COMF1: Comfortmeter has a Suggested Retail Price of \$64.99USD)
